Kino

A simple, safe way to free up space on your Mac. Kino finds the junk that apps leave behind, shows you what it is and how big it is, and **asks before deleting anything.**

No installs. No Python. Nothing to set up.

Before you start

1. **Quit your apps** (Chrome, Safari, Slack, Spotify). More can be cleaned when they're closed.
2. Have your **Mac login password** ready. You'll only need it for one optional step.

How to open it

Double-click `Kino.command`.

A Terminal window opens and Kino starts. That's it.

> ***First time only:*** *if macOS says it "can't be opened because Apple cannot check it",* ***right-click*** *the file, choose* ***Open****, then click* ***Open*** *again. After this one time, double-clicking works normally.*

What happens next

1. A one-minute tour

Kino explains what "cache" means and how to answer. You answer with **one key**, no Enter needed.

Press	What it does
Y	Yes, clear it
N	No, skip it

A	Yes to this one and all the remaining safe ones
Q	Quit and stop cleaning

There's a practice question so you can try it. Nothing is deleted during the tour. Press **S** at the start to skip it.

2. It scans your Mac

A progress bar shows how far along it is:

```
[##########                    ]  36%  Spotify
```

3. It goes through each app, one by one

Each app gets its own screen with what it is, how big it is, and where it lives:

```
[2 of 11]  Google Chrome  –  2.5 GB
  Saved web pages, images and scripts so sites load faster.
  You stay logged in; sites just reload a bit slower once.
  Location: ~/Library/Caches/com.google.Chrome
  Clear it?  [Y]es / [N]o / [A]ll / [Q]uit
```

Small caches from lots of apps are grouped into one line so you're not asked 100 times.

4. It may ask for your password

Some junk sits in protected system folders. Kino tells you **exactly what and why** before asking:

```
Some more junk needs your Mac password to remove:

  – System-wide app caches        2.4 GB
  – Time Machine local snapshots  3 found (can be many GB)

Enter your password to clean these too?  [Y]es / [N]o
```

- Press **N** to skip this whole section.

- When asked for the password, **nothing appears as you type**. That's normal. Type it and press Enter.
- The password only unlocks those folders. It is **not saved and not sent anywhere**, and Kino forgets it right after.
- You still get a Yes/No for each item.

5. It shows where your space is going

A short list of your biggest folders, then any file over **500 MB** with a number. Type the numbers you want to remove (like `1 3`) and press Enter.

These go to the **Trash**, not straight to deletion. You can get them back until you empty it.

6. Trash and results

Kino offers to empty the Trash, then shows your free space before and after.

What it will never touch

- Your photos, documents, music and videos
- Your Photos library
- Your real Time Machine backups
- Anything it hasn't asked you about first

Phone backups (iPhone/iPad) are marked **CAREFUL** and are always asked about one at a time.

Just want to look?

Run this in Terminal. Nothing gets deleted in this mode:

```
bash Kino.command --scan-only
```

Troubleshooting

Problem	Fix
Double-click does nothing or says permission denied	Open **Terminal**, type `bash ` (with a space), drag `Kino.command` into the window, press Enter.
"Apple cannot check it" message	Right-click the file, choose **Open**, then **Open** again.
macOS asks if Terminal can control Finder	Click **OK**. This lets Kino empty the Trash.
Password not accepted	Check Caps Lock. Use the password you log in to your Mac with.
Not much was freed	Close all apps and run Kino again.
